

Project Presentation

Pick4Me

Zero-Emission Hyperlocal Logistics & Smart Campus Supply Network

■ **Challenge Track:** Smart Buildings & Clean Campus Mobility
Decarbonizing Last-Mile Campus Mobility through Crowdsourced Foot Traffic & 2-Stage Escrow Protocols

■ **Project Lead:** Abhishek Kanadje & Team (abhishekkkanadje7@gmail.com)

■ **Live Application:** <https://pick4me-l868.onrender.com>

PROBLEM STATEMENT

Inefficient Last-Mile Logistics in Campus & Building Complexes

■ High Fuel Consumption	■ Campus Congestion & Noise	■ Invisibility & High Surge
Commercial quick-commerce fleets burn petrol for single low-value deliveries (stationery, snacks, medicines), creating excessive carbon emissions.	Motorized delivery two-wheelers cause noise pollution and traffic inside academic zones and residential hostel premises.	High delivery fees penalize students, while local campus shops remain invisible without an affordable digital catalog.

Decarbonizing Campus Mobility Through Human Routine Transit

■ The Green Crowdsourcing Hypothesis

Thousands of students walk daily between gates, libraries, and hostels with empty bags.

Pick4Me monetizes these existing walking routes to achieve **100% Zero-Emission Deliveries** without adding a single motorized vehicle.

■ Alignment with Energy Tech & Smart Buildings

- Zero Capital Expenditure on delivery fleets.
- Eliminates localized CO2 emissions in campus air.
- Energy efficient intra-building micro-supply chain.
- Circular campus economy benefiting local stores and student commuters.

SOLUTION OVERVIEW

The Pick4Me 3-Party Peer Commerce Ecosystem

■■ Customer A (Buyer)	■ Store Merchant	■ Customer B (Commuter)	■■ Admin Escrow
Orders from registered campus shops or posts custom errands with advance escrow safety.	Catalogs items and automatically receives 100% item payment upon shop counter pickup.	Claims delivery along routine walking route and receives reward into personal wallet.	Holds 100% funds securely and executes 2-stage automated payouts upon OTP verification.

WORKFLOW

2-Stage Autonomous Escrow Settlement Architecture

Step 1: Order & Advance Payment	Customer A orders lab manual and pays ■120 item + ■35 reward = ■155 to Admin Escrow.
Step 2: Commuter Claim	Customer B (student walking near shop) claims task on 'Deliver & Earn' board.
Step 3: Stage 1 Shop Handover	Customer B picks up at shop. Shopkeeper confirms & ■120 item cost is instantly credited to Shopkeeper's Wallet!
Step 4: Stage 2 Customer Handover	Customer B delivers to room. Customer A shares 4-digit OTP. Customer B enters OTP & ■35 (+Speed Bonus) is credited to Customer B's Wallet!

Measurable Decarbonization & Carbon Savings Metrics

0.15 kg CO2 Saved Per Delivery Compared to fossil fuel two wheelers	54.75 Tons Annual CO2 Avoided Per average campus with 1,000 daily deliveries	18,000+ L Petrol Conserved Zero fossil fuel consumed on daily errands	100% Zero Extra Vehicles Zero fleet noise or traffic congestion
